Introduction and Statement of the Problem

- Climate extremes and system failures are no longer peripheral shocks but routine stresses shaping WASH outcomes
- Evidence drawn from informal settlements across two climate-vulnerable Indian cities of Bhubaneswar and Jaipur
- Focus on governance systems that anticipate, absorb, adapt, and recover WASH services under stress
- Translating climate and contamination risk information into local WASH action
- Lowering long-term risk through institutionalised routines and controls

Operating principles across all components:

- Community ownership and continuous monitoring as an operating logic
- System strengthening, not parallel delivery
- Inclusion, gender responsiveness, and last-mile reach

Why Climate-Resilient WASH Governance is Necessary

- Floods, cyclones, heatwaves, and prolonged water scarcity now directly disrupt: water supply continuity, toilet functionality, and drainage and containment systems
- Informal settlements face: **higher exposure to contaminated water**, longer service downtimes, delayed emergency response
- Evaluations and ward planning processes show climate risk is now a primary determinant of: public health outcomes, gendered care burdens, equity in access to WASH services
- **Core problem:** Traditional WASH systems are reactive and infrastructure-centric

These findings emerge in a period of declining programme credibility and fragmented accountability in urban and rural WASH, making micro-governance evidence especially critical.

Context and Institutional Architecture

This focuses on contribution, not attribution, and on relative performance under stress rather than absolute service outcomes.

Settlement level:

- Community Management Committees (CMCs)
- Sanitation Sub-Committees (SSCs)
- Frontline monitoring of toilets, water points, drains

Ward level:

- Single Window Forums
- Engineers, PHED/WATCO, SWM, health staff, SHGs, MAS

City level:

- Multi-Stakeholder Forums
- Municipal corporations, PHED/WATCO, women & child development, health departments

Function: Pre-agreed triggers, roles, budgets, and response protocols for preparedness, emergency action, and follow-up.

Early Warning & Communication Systems: From Climate Data to WASH Decisions

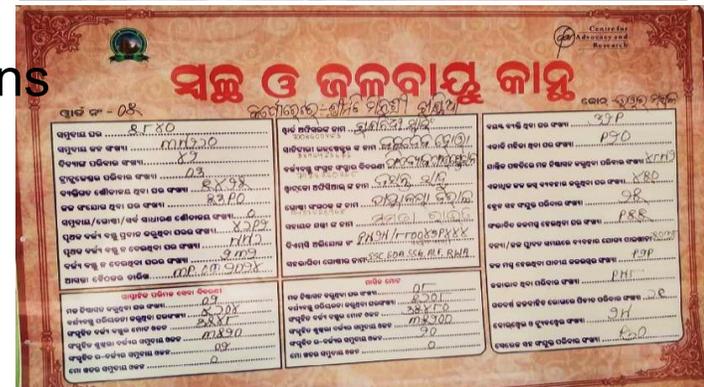

IVRS & Community Radio (Jaipur Vaani, Janhit Vaani)

- Heatwave, heavy rainfall, flood alerts
- Water storage, chlorination, and toilet-use advisories
- Emergency contamination warnings (do not drink, boil water, alternate sources)
- Caller Clubs ensured outreach beyond phone-owning households

IEC Wall Posters

- Seasonal and emergency checklists displayed in settlements
- Pre-monsoon, heat-season, flood, and contamination-response actions
- Reinforced routine preparedness and rapid response behaviours

Initial gaps identified:

- Climate and rainfall alerts did not guide WASH operations
- Water contamination risks were detected late, after illness spread
- Smartphone-based systems excluded the poorest households
- Alerts reduced information gaps but did not eliminate service disruptions during extreme events.

Governance response:

- Forecasts and alerts were experimentally translated into **specific, localised WASH actions**

Saniwall – From Monitoring to Emergency Response Tool

Original function: Public, ward-level dashboard tracking water, toilet and solid waste management functionality

Redesigned to include:

Early warning indicators:

- Water colour, smell, turbidity complaints
- Sudden diarrhoeal cases
- Pipeline breakage or backflow risk

Emergency response columns:

- Date/time of alert
- Temporary water supply provided
- Chlorination/flushing status
- Resolution timeline

Saniwall-triggered alerts based on community complaints.

Value:

Makes invisible service failures publicly visible

Associated with earlier detection and more coordinated initial municipal responses in select wards

SANIWALL
MONTHLY EMERGENCY RESPONSE AND SERVICE MONITORING DASHBOARD

Ward Name: _____ Ward No.: _____ Zone: _____
Month / Year: _____ Last Updated On: _____

A. WARD-LEVEL EARLY WARNING STATUS (COLOUR CODED SUMMARY)

Major Risk Indicator	Status	Remarks / Action Taken (if any)
Water Testing / Contamination	<input type="checkbox"/>	
Water Treatment / Households with Safe Water Storage	<input type="checkbox"/>	
Pipeline Breaks	<input type="checkbox"/>	
Discoloured Water / Leakages	<input type="checkbox"/>	
Sanitation System Failure / Overflow	<input type="checkbox"/>	
Water Supply Disruption	<input type="checkbox"/>	
Disease Outbreak Risk	<input type="checkbox"/>	
Flooding / Waterlogging	<input type="checkbox"/>	
Solid Waste Accumulation	<input type="checkbox"/>	

Legend: ● Safe – No immediate risk: ● Caution – Close monitoring required ● Critical – Immediate
Reporting Channels Used: Ward App IVRS / Phone Community Committee Field Inspection

B. RESPONSIBLE DEPARTMENT AND SERVICE ACCOUNTABILITY MATRIX

Issue Type	Responsible Dept.	Officer Name	No. of HHs	SLA (Govt Standard)	Status
Water Quality / Supply	WATCO / PHED	_____	_____	<input type="checkbox"/> Same Day <input type="checkbox"/> 24 hrs <input type="checkbox"/> 72hrs	
Sewer / Drainage	BMC – Sanitation	_____	_____	<input type="checkbox"/> Same Day <input type="checkbox"/> 24 hrs <input type="checkbox"/> 72hrs	
Solid Waste Management	BMC	_____	_____	<input type="checkbox"/> Same Day <input type="checkbox"/> 24 hrs <input type="checkbox"/> 72hrs	
Disease Surveillance	Health Dept	_____	_____	<input type="checkbox"/> 24 Hours <input type="checkbox"/> 72 hrs <input type="checkbox"/> 72hrs	
Flood / Waterlogging	Engineering Dept	_____	_____	<input type="checkbox"/> 24 Hours <input type="checkbox"/> 72 hrs <input type="checkbox"/> 72hrs	

C. HOUSEHOLD SERVICE TRACKER

Total Households: _____ Population: _____ M= _____ F= _____ TG= _____ SC= _____ ST= _____

Service Category	Household-Level Indicator: <input type="checkbox"/> No. of HHs <input type="checkbox"/> Date of Update <input type="checkbox"/> Remarks
Water Safety	Water Samples Tested (HHs / Sources)
Water Treatment	(boiling / filtration / chlorination, raised platforms)
Emergency Water Supply	Tankers Deployed (No. of HHs served)
Sanitation Services	Mechanised Desludging Completed
Disease Surveillance	Toilets Restored after Flood / Overflow
Solid Waste Management	Drain Cleaning / Dept

G. NOTES: DECISIONS AND ESCALATIONS
Decisions Taken in Ward Review: _____

H. RESPONSIBILITY FOR UPDATES
Updated By (Name AND Designation): Ward Officer

Climate-Resilient Water Safety Plans (CR-WSPs)

Expanded scope of CR-WSPs

- Climate hazards (floods, heat, scarcity)
- Water-quality hazards (contamination, backflow, stagnation)

Key components

Hazard mapping from source to point-of-use

Event-specific SOPs for:

- Flood-related contamination
- Pipeline breaches
- Heat-induced water quality deterioration

Clear role allocation:

- Community monitoring
- Engineer action
- Health response

Adaptive actions

- Raised toilets and water points in flood-prone settlements
- Pipeline slope correction and valve checks
- Dynamic service prioritisation for schools, anganwadis, health centres
- Continuous monitoring by Jalasathis, SHGs, and MAS during events

Institutionalising Resilience in Everyday Governance

Ward-level seasonal calendars institutionalised:

- Monsoon drain cleaning
- Heat-season conservation and storage practices
- Contamination risk checks during heavy rainfall

Annual updating of SOPs by:

- Engineers
- SHGs, MAS
- Caller Clubs and community committees

KPIs tracked:

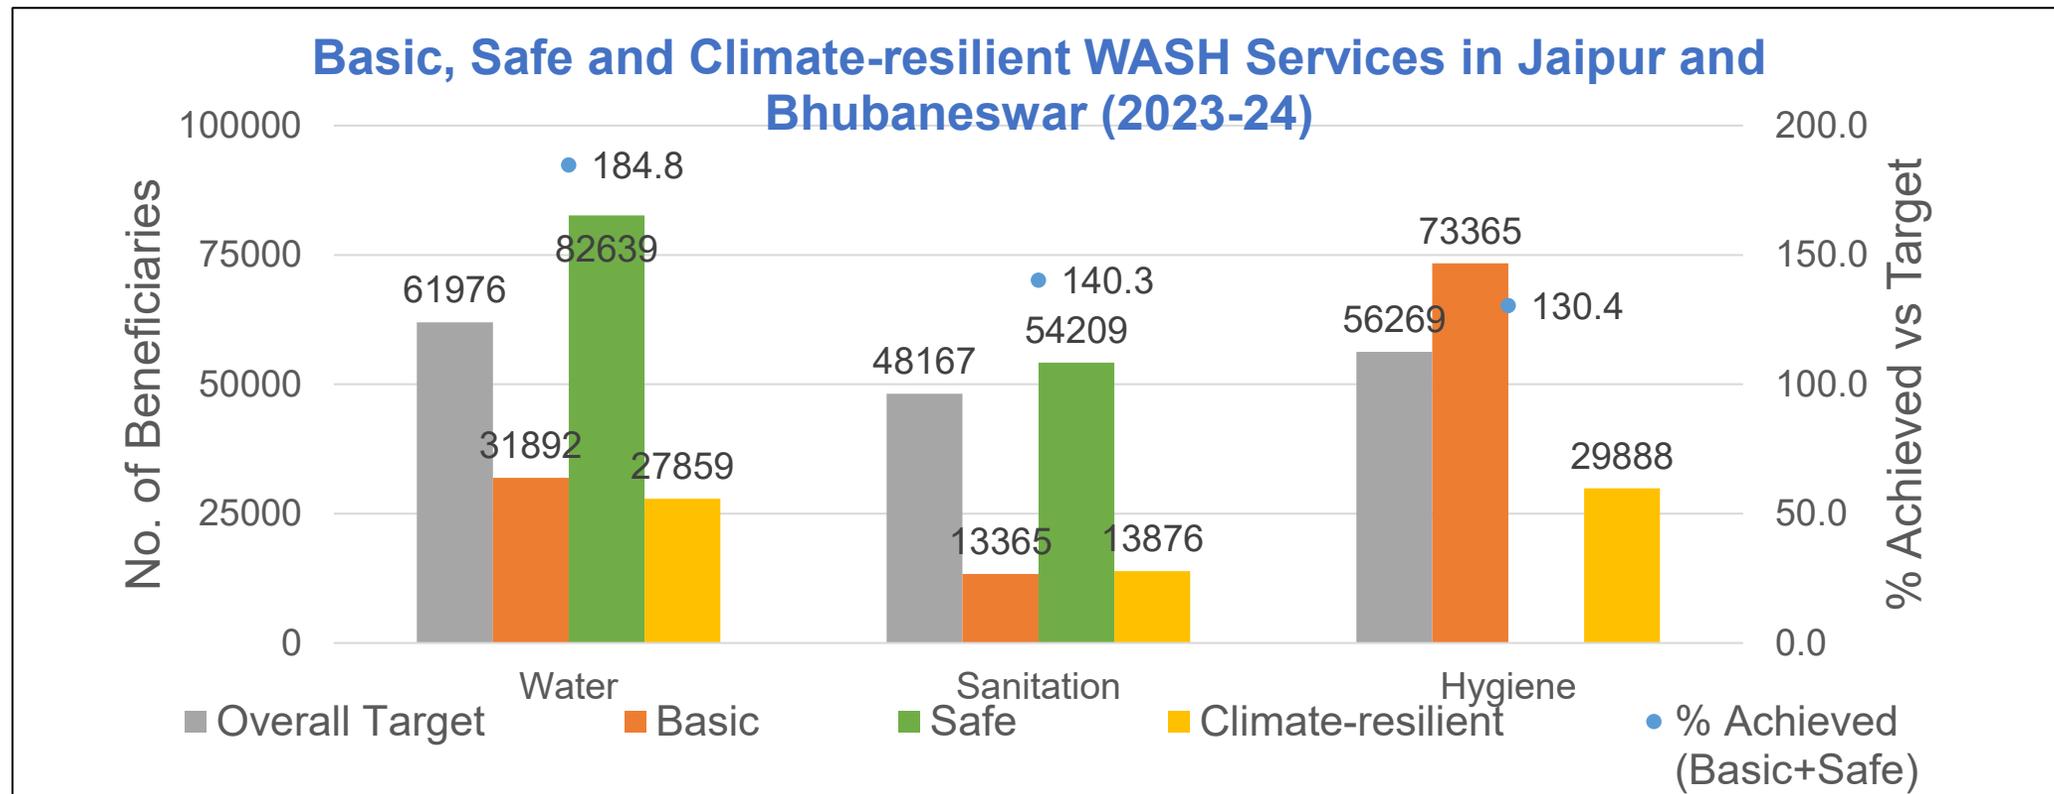

- Toilet functionality during heavy rain days
- Time taken to respond to contamination alerts
- Service restoration timelines

In select wards, resilience practices began to shift from time-bound project activities toward more routine service management behaviours.

Scale and Impact

Scale & outcomes

- Total beneficiaries: 393,376
- Direct access to climate-resilient WASH: 71,623 (18.2%)
- 39% reported improved reliability and perceived safety of water access

Key Takeaways and Way forward

Key takeaways

- To sustain the progress made and prevent slippage, continued vigilance and governance attention are required to ensure that gains are sustained over time.
- Forecasts and contamination alerts must translate into ward-level action
- Ownership with communities multiplies system resilience

Priority actions going forward

- Integrate CR-WSPs and Saniwall indicators into municipal MIS
- Standardise contamination emergency SOPs at ward level
- Scale IVRS-based early warning and advisory systems
- Make inclusive retrofits and frontline PPE non-negotiable

Call to Action:

Let data lead, and people guide the way.

Thank You
